

Low Cost, High Speed, Rail-to-Rail, Output Op Amps

ADA4851-4

FEATURES

Qualified for automotive applications High speed 130 MHz, −3 dB bandwidth 375 V/μs slew rate 55 ns settling time to 0.1% Excellent video specifications 0.1 dB flatness: 11 MHz Differential gain: 0.08% Differential phase: 0.09° Fully specified at +3 V, +5 V, and ±5 V supplies Rail-to-rail output Output swings to within 60 mV of either rail Low voltage offset: 0.6 mV Wide supply range: 2.7 V to 12 V Low power: 2.5 mA per amplifier Power-down mode Available in space-saving packages 6-lead SOT-23, 8-lead MSOP, and 14-lead TSSOP

APPLICATIONS

Automotive infotainment systems Automotive driver assistance systems Consumer video Professional video Video switchers Active filters Clock buffers

GENERAL DESCRIPTION

The ADA4851-1 (single), ADA4851-2 (dual), and ADA4851-4 (quad) are low cost, high speed, voltage feedback rail-to-rail output op amps. Despite their low price, these parts provide excellent overall performance and versatility. The 130 MHz, −3 dB bandwidth and high slew rate make these amplifiers well suited for many general-purpose, high speed applications.

The ADA4851 family is designed to operate at supply voltages as low as $+3$ V and up to ± 5 V. These parts provide true singlesupply capability, allowing input signals to extend 200 mV below the negative rail and to within 2.2 V of the positive rail. On the output, the amplifiers can swing within 60 mV of either supply rail.

With their combination of low price, excellent differential gain (0.08%), differential phase (0.09º), and 0.1 dB flatness out to 11 MHz, these amplifiers are ideal for consumer video applications.

The ADA4851-1W, ADA4851-2W, and ADA4851-4W are automotive grade versions, qualified for automotive applications.

SPECIFICATIONS

SPECIFICATIONS WITH +3 V SUPPLY

T_A = 25°C, R_F = 0 Ω for G = +1, R_F = 1 kΩ for G > +1, R_L = 1 kΩ, unless otherwise noted.

SPECIFICATIONS WITH +5 V SUPPLY

T_A = 25°C, R_F = 0 Ω for G = +1, R_F = 1 kΩ for G > +1, R_L = 1 kΩ, unless otherwise noted.

Table 2.

SPECIFICATIONS WITH ±5 V SUPPLY

 $T_A = 25^{\circ}\text{C}$, $R_F = 0 \Omega$ for $G = +1$, $R_F = 1 \text{ k}\Omega$ for $G > +1$, $R_L = 1 \text{ k}\Omega$, unless otherwise noted.

Table 3.

ABSOLUTE MAXIMUM RATINGS

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

THERMAL RESISTANCE

θ_{JA} is specified for the worst-case conditions; that is, θ_{JA} is specified for device soldered in circuit board for surface-mount packages.

Table 5. Thermal Resistance

Maximum Power Dissipation

The maximum safe power dissipation for the ADA4851-1/ ADA4851-2/ADA4851-4 is limited by the associated rise in junction temperature (T_J) on the die. At approximately 150°C, which is the glass transition temperature, the plastic changes its properties. Even temporarily exceeding this temperature limit may change the stresses that the package exerts on the die, permanently shifting the parametric performance of the amplifiers. Exceeding a junction temperature of 150°C for an extended period can result in changes in silicon devices, potentially causing degradation or loss of functionality.

The power dissipated in the package (P_D) is the sum of the quiescent power dissipation and the power dissipated in the die due to the drive of the amplifier at the output. The quiescent power is the voltage between the supply pins (V_s) times the quiescent current (I_s).

Table 4. Table 4. *P***_D =** *Quiescent Power* **+ (***Total Drive Power* **−** *Load Power***)**

$$
P_D = (V_s \times I_s) + \left(\frac{V_s}{2} \times \frac{V_{OUT}}{R_L}\right) - \frac{V_{OUT}^2}{R_L}
$$

RMS output voltages should be considered. If RL is referenced to $-V$ _S, as in single-supply operation, the total drive power is $V_S \times I_{\text{OUT}}$. If the rms signal levels are indeterminate, consider the worst case, when $V_{\text{OUT}} = V_s/4$ for R_L to midsupply.

$$
P_D = (V_S \times I_S) + \frac{(V_S/4)^2}{R_L}
$$

In single-supply operation with RL referenced to −Vs, the worst case is $V_{\text{OUT}} = V_s/2$.

Airflow increases heat dissipation, effectively reducing θ_{IA} . In addition, more metal directly in contact with the package leads and through holes under the device reduces θ_{IA} .

[Figure 5](#page-9-1) shows the maximum safe power dissipation in the package vs. the ambient temperature for the 6-lead SOT-23 (170°C/W), the 8-lead MSOP (150°C/W), and the 14-lead TSSOP (120°C/W) on a JEDEC standard 4-layer board. θ_{JA} values are approximations.

Figure 5. Maximum Power Dissipation vs. Temperature for a 4-Layer Board

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

TYPICAL PERFORMANCE CHARACTERISTICS

 $T_A = 25^{\circ}C$, $R_F = 0 \Omega$ for $G = +1$, $R_F = 1$ k Ω for $G > +1$, $R_L = 1$ k Ω , unless otherwise noted.

CIRCUIT DESCRIPTION

The ADA4851-1/ADA4851-2/ADA4851-4 feature a high slew rate input stage that is a true single-supply topology, capable of sensing signals at or below the negative supply rail. The rail-torail output stage can pull within 60 mV of either supply rail when driving light loads and within 0.17 V when driving 150 Ω . High speed performance is maintained at supply voltages as low as 2.7 V.

HEADROOM CONSIDERATIONS

These amplifiers are designed for use in low voltage systems. To obtain optimum performance, it is useful to understand the behavior of the amplifiers as input and output signals approach the headroom limits of the amplifiers. The input common-mode voltage range of the amplifiers extends from the negative supply voltage (actually 200 mV below the negative supply), or from ground for single-supply operation, to within 2.2 V of the positive supply voltage. Therefore, at a gain of 3, the amplifiers can provide full rail-to-rail output swing for supply voltages as low as 3.3 V and down to 3 V for a gain of 4.

Exceeding the headroom limit is not a concern for any inverting gain on any supply voltage as long as the reference voltage at the positive input of the amplifier lies within the input common- mode range of the amplifier.

The input stage is the headroom limit for signals approaching the positive rail. [Figure 40](#page-16-1) shows a typical offset voltage vs. the input common-mode voltage for the ADA4851-1/ADA4851-2/ ADA4851-4 amplifiers on a \pm 5 V supply. Accurate dc performance is maintained from approximately 200 mV below the negative supply to within 2.2 V of the positive supply. For high speed signals, however, there are other considerations. [Figure 41](#page-16-2) shows −3 dB bandwidth vs. input common-mode voltage for a unity-gain follower. As the common-mode voltage approaches 2 V of positive supply, the amplifier responds well but the bandwidth begins to drop as the common-mode voltage approaches the positive supply. This can manifest itself in increased distortion or settling time. Higher frequency signals require more headroom than the lower frequencies to maintain distortion performance.

Figure 41. Unity-Gain Follower Bandwidth vs. Input Common-Mode

[Figure 42](#page-17-1) illustrates how the rising edge settling time for the amplifier is configured as a unity-gain follower, stretching out as the top of a 1 V step input that approaches and exceeds the specified input common-mode voltage limit.

For signals approaching the negative supply and inverting gain and high positive gain configurations, the headroom limit is the output stage. The ADA4851-1/ADA4851-2/ADA4851-4 amplifiers use a common emitter output stage. This output stage maximizes the available output range, limited by the saturation voltage of the output transistors. The saturation voltage increases with the drive current that the output transistor is required to supply due to the collector resistance of the output transistor.

Figure 42. Output Rising Edge for 1 V Step at Input Headroom Limits

As the saturation point of the output stage is approached, the output signal shows increasing amounts of compression and clipping. As in the input headroom case, higher frequency signals require slightly more headroom than the lower frequency signals. [Figure 16](#page-11-0) illustrates this point by plotting the typical harmonic distortion vs. the output amplitude.

OVERLOAD BEHAVIOR AND RECOVERY

Input

The specified input common-mode voltage of the ADA4851-1/ ADA4851-2/ADA4851-4 is 200 mV below the negative supply to within 2.2 V of the positive supply. Exceeding the top limit results in lower bandwidth and increased rise time, as shown in [Figure 41](#page-16-2) and [Figure 42.](#page-17-1) Pushing the input voltage of a unitygain follower to less than 2 V from the positive supply leads to the behavior shown in [Figure 43](#page-17-2)—an increasing amount of output error as well as a much increased settling time. The recovery time from input voltages of 2.2 V or closer to the positive supply is approximately 55 ns, which is limited by the settling artifacts caused by transistors in the input stage coming out of saturation.

The amplifiers do not exhibit phase reversal, even for input voltages beyond the voltage supply rails. Going more than 0.6 V beyond the power supplies turns on protection diodes at the input stage, which greatly increases the current draw of the devices.

Figure 43. Pulse Response of $G = +1$ Follower, Input Step Overloading the Input Stage

Output

Output overload recovery is typically within 35 ns after the input of the amplifier is brought to a nonoverloading value. [Figure 44](#page-17-3) shows output recovery transients for the amplifier configured in an inverting gain of 1 recovering from a saturated output from the top and bottom supplies to a point at midsupply.

The ADA4851 family of amplifiers is well suited for portable video applications. When operating in low voltage single-supply applications, the input signal is limited by the input stage headroom. For additional information, see the [Headroom](#page-16-3) [Considerations](#page-16-3) section. [Table 6](#page-18-1) shows the recommended values for voltage, input signal, various gains, and output signal swing for the typical video amplifier shown in [Figure 45](#page-18-2).

Table 6. Recommended Values

VIDEO RECONSTRUCTION FILTER

At higher frequencies, active filters require wider bandwidths to work properly. Excessive phase shift introduced by lower frequency op amps can significantly affect the filter performance.

A common application for active filters is at the output of video DACs/encoders. The filter, or more appropriately, the video reconstruction filter, is used at the output of a video DAC/ encoder to eliminate the multiple images that are created during the sampling process within the DAC. For portable video applications, the ADA4851 family of amplifiers is an ideal choice due to its lower power requirements and high performance.

SINGLE-SUPPLY VIDEO AMPLIFIER An example of an 8 MHz, three-pole, Sallen-Key, low-pass, video reconstruction filter is shown in [Figure 46](#page-18-3). This circuit features a gain of 3, has a 0.1 dB bandwidth of 8.2 MHz, and over 17 dB attenuation at 27 MHz (see [Figure 47](#page-18-4)). The filter has three poles; two are active with a third passive pole (R6 and C4) placed at the output. C3 improves the filter roll-off. R6, R7, and R8 comprise the video load of 150 Ω. Components R6, C4, R7, R8, and the input termination of the network analyzer form a 12.8 dB attenuator; therefore, the reference level is roughly −3.3 dB, as shown in [Figure 47](#page-18-4).

ORDERING GUIDE

1 Z = RoHS Compliant Part.

 2 W = qualified for automotive applications.

AUTOMOTIVE PRODUCTS

The ADA4851-1W/ADA4851-2W/ADA4851-4W models are available with controlled manufacturing to support the quality and reliability requirements of automotive applications. Note that these automotive models may have specifications that differ from the commercial models; therefore, designers should review the Specifications section of this data sheet carefully. Only the automotive grade products shown are available for use in automotive applications. Contact your local Analog Devices, Inc., account representative for specific product ordering information and to obtain the specific Automotive Reliability reports for these models.
