

# Single 400MHz Current Feedback Amplifier

## FEATURES

- 400MHz Bandwidth on  $\pm 5V$  ( $A_V = 1$ )
- 350MHz Bandwidth on  $\pm 5V$  ( $A_V = 2, -1$ )
- 0.1dB Gain Flatness: 100MHz ( $A_V = 1, 2$  and  $-1$ )
- High Slew Rate: 800V/ $\mu$ s
- Wide Supply Range:  $\pm 2V(4V)$  to  $\pm 6V(12V)$
- 80mA Output Current
- Low Supply Current: 4.6mA/Amplifier
- LT1395: SO-8, TSOT23-5 and TSOT23-6 Packages
- LT1396: SO-8, MSOP and Tiny 3mm  $\times$  3mm  $\times$  0.75mm DFN-8 Packages
- LT1397: SO-14, SSOP-16 and Tiny 4mm  $\times$  3mm  $\times$  0.75mm DFN-14 Packages
- Low Profile (1mm) ThinSOT™ Package

## APPLICATIONS

- Cable Drivers
- Video Amplifiers
- MUX Amplifiers
- High Speed Portable Equipment
- IF Amplifiers

## DESCRIPTION

The LT<sup>®</sup>1395/LT1396/LT1397 are single/dual/quad 400MHz current feedback amplifiers with an 800V/ $\mu$ s slew rate and the ability to drive up to 80mA of output current.

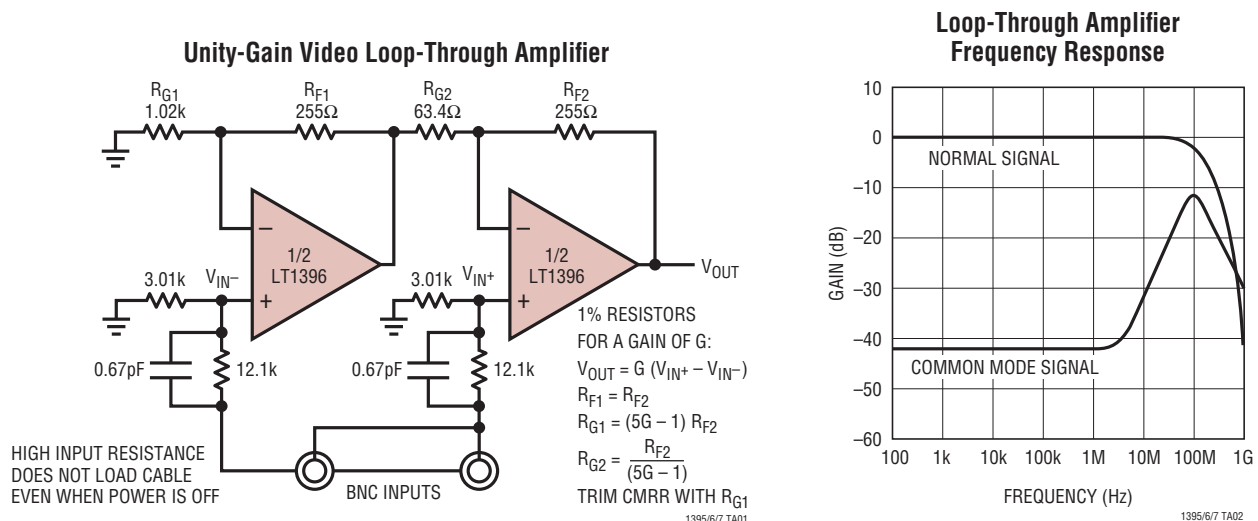

The LT1395/LT1396/LT1397 operate on all supplies from a single 4V to  $\pm 6V$ . At  $\pm 5V$ , they draw 4.6mA of supply current per amplifier. The LT1395CS6 also adds a shutdown pin. When disabled, the LT1395CS6 draws virtually zero supply current and its output becomes high impedance. The LT1395CS6 will turn on in only 30ns and turn off in 40ns, making it ideal in spread spectrum and portable equipment applications.

For space limited applications, the LT1395 is available in TSOT-23 packages, the LT1396 is available in a tiny 3mm  $\times$  3mm  $\times$  0.75mm dual fine pitch leadless DFN package, and the LT1397 is available in a tiny 4mm  $\times$  3mm  $\times$  0.75mm DFN package.

The LT1395/LT1396/LT1397 are manufactured on Linear Technology's proprietary complementary bipolar process. They have standard single/dual/quad pinouts and they are optimized for use on supply voltages of  $\pm 5V$ .

LT, LT, LTC, LTM, Linear Technology and the Linear logo are registered trademarks of Linear Technology Corporation. All other trademarks are the property of their respective owners.

## TYPICAL APPLICATION

## ABSOLUTE MAXIMUM RATINGS (Note 1)

Total Supply Voltage ( $V^+$ to $V^-$ ) .....	12.6V	Specified Temperature Range (Note 5)	
Input Current (Note 2).....	$\pm 10\text{mA}$	LT1395C/LT1396C/LT1397C .....	$0^\circ\text{C}$ to $70^\circ\text{C}$
Output Current .....	$\pm 100\text{mA}$	LT1397H .....	$-40^\circ\text{C}$ to $125^\circ\text{C}$
Differential Input Voltage (Note 2).....	$\pm 5\text{V}$	Storage Temperature Range.....	$-65^\circ\text{C}$ to $150^\circ\text{C}$
Output Short-Circuit Duration (Note 3) .....	Continuous	Storage Temperature Range	
Operating Temperature Range (Note 4)		(DD Package).....	$-65^\circ\text{C}$ to $125^\circ\text{C}$
LT1395C/LT1396C/LT1397C .....	$-40^\circ\text{C}$ to $85^\circ\text{C}$	Junction Temperature (Note 6)	$150^\circ\text{C}$
LT1397H .....	$-40^\circ\text{C}$ to $125^\circ\text{C}$	Junction Temperature (DD Package) (Note 6).....	$125^\circ\text{C}$

dP	Differential Phase (Note 8)	$R_F = R_G = 255\Omega$ , $R_L = 150\Omega$		0.04		DEG

**Note 1:** Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

**Note 2:** This parameter is guaranteed to meet specified performance through design and characterization. It has not been tested.

**Note 3:** A heat sink may be required depending on the power supply voltage and how many amplifiers have their outputs short circuited. The  $\theta_{JA}$  specified for the DD package is with minimal PCB heat spreading metal. Using expanded metal area on all layers of a board reduces this value.

**Note 4:** The LT1395C/LT1396C/LT1397C are guaranteed functional over the operating temperature range of  $-40^\circ\text{C}$  to  $85^\circ\text{C}$ . The LT1397H is guaranteed functional over the operating temperature range of  $-40^\circ\text{C}$  to  $125^\circ\text{C}$ .

**Note 5:** The LT1395C/LT1396C/LT1397C are guaranteed to meet specified performance from  $0^\circ\text{C}$  to  $70^\circ\text{C}$ . The LT1395C/LT1396C/LT1397C are designed, characterized and expected to meet specified performance from  $-40^\circ\text{C}$  and  $85^\circ\text{C}$  but are not tested or QA sampled at these temperatures. The LT1397H is guaranteed to meet specified performance from  $-40^\circ\text{C}$  to  $125^\circ\text{C}$ . For guaranteed I-grade parts, consult the factory.

**Note 6:**  $T_J$  is calculated from the ambient temperature  $T_A$  and the power dissipation  $P_D$  according to the following formula:

$$\text{LT1395CS5: } T_J = T_A + (P_D \cdot 250^\circ\text{C/W})$$

$$\text{LT1396CS6: } T_J = T_A + (P_D \cdot 230^\circ\text{C/W})$$

$$\text{LT1395CS8: } T_J = T_A + (P_D \cdot 150^\circ\text{C/W})$$

$$\text{LT1396CS8: } T_J = T_A + (P_D \cdot 150^\circ\text{C/W})$$

$$\text{LT1396CMS8: } T_J = T_A + (P_D \cdot 250^\circ\text{C/W})$$

$$\text{LT1396CDD: } T_J = T_A + (P_D \cdot 160^\circ\text{C/W})$$

$$\text{LT1397CS14: } T_J = T_A + (P_D \cdot 100^\circ\text{C/W})$$

$$\text{LT1397CGN16: } T_J = T_A + (P_D \cdot 135^\circ\text{C/W})$$

$$\text{LT1397CDE: } T_J = T_A + (P_D \cdot 43^\circ\text{C/W})$$

$$\text{LT1397HDE: } T_J = T_A + (P_D \cdot 43^\circ\text{C/W})$$

**Note 7:** Slew rate is measured at  $\pm 2\text{V}$  on a  $\pm 3\text{V}$  output signal.

**Note 8:** Differential gain and phase are measured using a Tektronix TSG120YC/NTSC signal generator and a Tektronix 1780R Video Measurement Set. The resolution of this equipment is 0.1% and 0.1°. Ten identical amplifier stages were cascaded giving an effective resolution of 0.01% and 0.01°.

**Note 9:** For LT1395CS6, turn-on delay time ( $t_{ON}$ ) is measured from control input to appearance of 1V(50%) at the output, for  $V_{IN} = 1\text{V}$  and  $A_V = 2$ . Likewise, turn-off delay time ( $t_{OFF}$ ) is measured from control input to appearance of 1V(50%) on the output for  $V_{IN} = 1\text{V}$  and  $A_V = 2$ . This specification is guaranteed by design and characterization.

## PIN FUNCTIONS

### LT1395CS5

**OUT (Pin 1):** Output.

**V<sup>-</sup> (Pin 2):** Negative Supply Voltage, Usually -5V.

**+IN (Pin 3):** Noninverting Input.

**-IN (Pin 4):** Inverting Input.

**V<sup>+</sup> (Pin 5):** Positive Supply Voltage, Usually 5V.

### LT1395CS6

**OUT (Pin 1):** Output.

**V<sup>-</sup> (Pin 2):** Negative Supply Voltage, Usually -5V.

**+IN (Pin 3):** Noninverting Input.

**-IN (Pin 4):** Inverting Input.

**$\overline{\text{EN}}$  (Pin 5):** Enable Pin. Logic low to enable.

**V<sup>+</sup> (Pin 6):** Positive Supply Voltage, Usually 5V.

### LT1395CS8

**NC (Pin 1):** No Connection.

**-IN (Pin 2):** Inverting Input.

**+IN (Pin 3):** Noninverting Input.

**V<sup>-</sup> (Pin 4):** Negative Supply Voltage, Usually -5V.

**NC (Pin 5):** No Connection.

**OUT (Pin 6):** Output.

**V<sup>+</sup> (Pin 7):** Positive Supply Voltage, Usually 5V.

**NC (Pin 8):** No Connection.

### LT1396CMS8, LT1396CS8, LT1396CDD

**OUT A (Pin 1):** A Channel Output.

**-IN A (Pin 2):** Inverting Input of A Channel Amplifier.

**+IN A (Pin 3):** Noninverting Input of A Channel Amplifier.

**V<sup>-</sup> (Pin 4):** Negative Supply Voltage, Usually -5V.

**+IN B (Pin 5):** Noninverting Input of B Channel Amplifier.

**-IN B (Pin 6):** Inverting Input of B Channel Amplifier.

**OUT B (Pin 7):** B Channel Output.

**V<sup>+</sup> (Pin 8):** Positive Supply Voltage, Usually 5V.

### LT1397CS, LT1397CDE, LT1397HDE

**OUT A (Pin 1):** A Channel Output.

**-IN A (Pin 2):** Inverting Input of A Channel Amplifier.

**+IN A (Pin 3):** Noninverting Input of A Channel Amplifier.

**V<sup>+</sup> (Pin 4):** Positive Supply Voltage, Usually 5V.

**+IN B (Pin 5):** Noninverting Input of B Channel Amplifier.

**-IN B (Pin 6):** Inverting Input of B Channel Amplifier.

**OUT B (Pin 7):** B Channel Output.

**OUT C (Pin 8):** C Channel Output.

**-IN C (Pin 9):** Inverting Input of C Channel Amplifier.

**+IN C (Pin 10):** Noninverting Input of C Channel Amplifier.

**V<sup>-</sup> (Pin 11):** Negative Supply Voltage, Usually -5V.

**+IN D (Pin 12):** Noninverting Input of D Channel Amplifier.

**-IN D (Pin 13):** Inverting Input of D Channel Amplifier.

**OUT D (Pin 14):** D Channel Output.

### LT1397CGN

**OUT A (Pin 1):** A Channel Output.

**-IN A (Pin 2):** Inverting Input of A Channel Amplifier.

**+IN A (Pin 3):** Noninverting Input of A Channel Amplifier.

**V<sup>+</sup> (Pin 4):** Positive Supply Voltage, Usually 5V.

**+IN B (Pin 5):** Noninverting Input of B Channel Amplifier.

**-IN B (Pin 6):** Inverting Input of B Channel Amplifier.

**OUT B (Pin 7):** B Channel Output.

**NC (Pin 8):** No Connection.

**NC (Pin 9):** No Connection.

**OUT C (Pin 10):** C Channel Output.

**-IN C (Pin 11):** Inverting Input of C Channel Amplifier.

**+IN C (Pin 12):** Noninverting Input of C Channel Amplifier.

**V<sup>-</sup> (Pin 13):** Negative Supply Voltage, Usually -5V.

**+IN D (Pin 14):** Noninverting Input of D Channel Amplifier.

**-IN D (Pin 15):** Inverting Input of D Channel Amplifier.

**OUT D (Pin 16):** D Channel Output.

## APPLICATIONS INFORMATION

### Feedback Resistor Selection

The small-signal bandwidth of the LT1395/LT1396/LT1397 is set by the external feedback resistors and the internal junction capacitors. As a result, the bandwidth is a function of the supply voltage, the value of the feedback resistor, the closed-loop gain and the load resistor. The LT1395/LT1396/LT1397 have been optimized for  $\pm 5V$  supply operation and have a  $-3dB$  bandwidth of 400MHz at a gain of 1 and 350MHz at a gain of 2. Please refer to the resistor selection guide in the Typical AC Performance table.

### Capacitance on the Inverting Input

Current feedback amplifiers require resistive feedback from the output to the inverting input for stable operation. Take care to minimize the stray capacitance between the output and the inverting input. Capacitance on the inverting input to ground will cause peaking in the frequency response (and overshoot in the transient response).

### Capacitive Loads

The LT1395/LT1396/LT1397 can drive many capacitive loads directly when the proper value of feedback resistor is used. The required value for the feedback resistor will increase as load capacitance increases and as closed-loop gain decreases. Alternatively, a small resistor ( $5\Omega$  to  $35\Omega$ ) can be put in series with the output to isolate the capacitive load from the amplifier output. This has the advantage that the amplifier bandwidth is only reduced when the capacitive load is present. The disadvantage is that the gain is a function of the load resistance. See the Typical Performance Characteristics curves.

### Power Supplies

The LT1395/LT1396/LT1397 will operate from single or split supplies from  $\pm 2V$  (4V total) to  $\pm 6V$  (12V total). It is not necessary to use equal value split supplies, however the offset voltage and inverting input bias current will change. The offset voltage changes about 2.5mV per volt of supply mismatch. The inverting bias current will typically change about  $10\mu A$  per volt of supply mismatch.

### Slew Rate

Unlike a traditional voltage feedback op amp, the slew rate of a current feedback amplifier is not independent of the amplifier gain configuration. In a current feedback amplifier, both the input stage and the output stage have slew rate limitations. In the inverting mode, and for gains of 2 or more in the noninverting mode, the signal amplitude between the input pins is small and the overall slew rate is that of the output stage. For gains less than 2 in the noninverting mode, the overall slew rate is limited by the input stage.

The input slew rate of the LT1395/LT1396/LT1397 is approximately  $600V/\mu s$  and is set by internal currents and capacitances. The output slew rate is set by the value of the feedback resistor and internal capacitance. At a gain of 2 with  $255\Omega$  feedback and gain resistors and  $\pm 5V$  supplies, the output slew rate is typically  $800V/\mu s$ . Larger feedback resistors will reduce the slew rate as will lower supply voltages.

### Enable/Disable

The LT1395CS6 has a unique high impedance, zero supply current mode which is controlled by the  $\overline{EN}$  pin. The LT1395CS6 is designed to operate with CMOS logic; it draws virtually zero current when the  $\overline{EN}$  pin is high. To activate the amplifier, its  $\overline{EN}$  pin is normally pulled to a logic low. However, supply current will vary as the voltage between the  $V^+$  supply and  $\overline{EN}$  is varied. As seen in Figure 1,  $+I_S$  does vary with  $(V^+ - V_{\overline{EN}})$ , particularly when the voltage difference is less than 3V. For normal

Figure 1.  $+I_S$  vs  $(V^+ - V_{\overline{EN}})$

## APPLICATIONS INFORMATION

Figure 2. Amplifier Enable Time,  $A_V = 2$

Figure 3. Amplifier Disable Time,  $A_V = 2$

operation, it is important to keep the  $\overline{EN}$  pin at least 3V below the  $V^+$  supply. If a  $V^+$  of less than 3V is desired, and the amplifier will remain enabled at all times, then the  $\overline{EN}$  pin should be tied to the  $V^-$  supply. The enable pin current is approximately 30 $\mu$ A when activated. If using CMOS open-drain logic, an external 1k pull-up resistor is recommended to ensure that the LT1395CS6 remains disabled in spite of any CMOS drain leakage currents.

The enable/disable times are very fast when driven from standard 5V CMOS logic. The LT1395CS6 enables in about 30ns (50% point to 50% point) while operating on  $\pm 5V$  supplies (Figure 2). Likewise, the disable time is approximately 40ns (50% point to 50% point) (Figure 3).

### Differential Input Signal Swing

To avoid any breakdown condition on the input transistors, the differential input swing must be limited to  $\pm 5V$ . In normal operation, the differential voltage between the input pins is small, so the  $\pm 5V$  limit is not an issue.

### Buffered RGB to Color-Difference Matrix

An LT1397 can be used to create buffered color-difference signals from RGB inputs (Figure 4). In this application, the R input arrives via 75 $\Omega$  coax. It is routed to the non-inverting input of LT1397 amplifier A1 and to a 845 $\Omega$  resistor R8. There is also an 82.5 $\Omega$  termination resistor R11, which yields a 75 $\Omega$  input impedance at the R input when considered in parallel with R8. R8 connects to the inverting input of a second LT1397 amplifier (A2), which also sums the weighted G and B inputs to create a  $-0.5 \cdot Y$  output. LT1397 amplifier A3 then takes the  $-0.5 \cdot Y$  output and amplifies it by a gain of  $-2$ , resulting in the Y output. Amplifier A1 is configured in a noninverting gain of 2 with the bottom of the gain resistor R2 tied to the Y output. The output of amplifier A1 thus results in the color-difference output R-Y.

The B input is similar to the R input. It arrives via 75 $\Omega$  coax, and is routed to the noninverting input of LT1397 amplifier A4, and to a 2320 $\Omega$  resistor R10. There is also a 76.8 $\Omega$  termination resistor R13, which yields a 75 $\Omega$

## APPLICATIONS INFORMATION

input impedance when considered in parallel with R10. R10 also connects to the inverting input of amplifier A2, adding the B contribution to the Y signal as discussed above. Amplifier A4 is configured in a noninverting gain of 2 configuration with the bottom of the gain resistor R4 tied to the Y output. The output of amplifier A4 thus results in the color-difference output B-Y.

The G input also arrives via 75Ω coax and adds its contribution to the Y signal via a 432Ω resistor R9, which is tied to the inverting input of amplifier A2. There is also a 90.9Ω termination resistor R12, which yields a 75Ω termination when considered in parallel with R9. Using superposition, it is straightforward to determine the output of amplifier A2. Although inverted, it sums the R, G and B signals in the standard proportions of 0.3R, 0.59G and 0.11B that are used to create the Y signal. Amplifier A3 then inverts and amplifies the signal by 2, resulting in the Y output.

### Buffered Color-Difference to RGB Matrix

An LT1395 combined with an LT1396 can be used to create buffered RGB outputs from color-difference signals (Figure 5). The R output is a back-terminated 75Ω signal created using resistor R5 and amplifier A1 configured for a gain of +4 via resistors R3 and R4. The noninverting input of amplifier A1 is connected via 1k resistors R1 and R2 to the Y and R-Y inputs respectively, resulting in cancellation of the Y signal at the amplifier input. The remaining R signal is then amplified by A1.

The B output is also a back-terminated 75Ω signal created using resistor R16 and amplifier A3 configured for a gain of +4 via resistors R14 and R15. The noninverting input of amplifier A3 is connected via 1k resistors R12 and R13 to the Y and B-Y inputs respectively, resulting in cancellation of the Y signal at the amplifier input. The remaining B signal is then amplified by A3.

The G output is the most complicated of the three. It is a weighted sum of the Y, R-Y and B-Y inputs. The Y input is attenuated via resistors R6 and R7 such that amplifier A2's noninverting input sees 0.83Y. Using superposition, we can calculate the positive gain of A2 by assuming that

R8 and R9 are grounded. This results in a gain of 2.41 and a contribution at the output of A2 of 2Y. The R-Y input is amplified by A2 with the gain set by resistors R8 and R10, giving an amplification of -1.02. This results in a contribution at the output of A2 of 1.02Y - 1.02R. The B-Y input is amplified by A2 with the gain set by resistors R9 and R10, giving an amplification of -0.37. This results in a contribution at the output of A2 of 0.37Y - 0.37B.

If we now sum the three contributions at the output of A2, we get:

$$A2_{OUT} = 3.40Y - 1.02R - 0.37B$$

It is important to remember though that Y is a weighted sum of R, G and B such that:

$$Y = 0.3R + 0.59G + 0.11B$$

If we substitute for Y at the output of A2 we then get:

$$A2_{OUT} = (1.02R - 1.02R) + 2G + (0.37B - 0.37B) = 2G$$

The back-termination resistor R11 then halves the output of A2 resulting in the G output.

## TYPICAL APPLICATION

### Single Supply RGB Video Amplifier

The LT1395 can be used with a single supply voltage of 6V or more to drive ground-referenced RGB video. In Figure 6, two 1N4148 diodes D1 and D2 have been placed in series with the output of the LT1395 amplifier A1 but within the feedback loop formed by resistor R8. These diodes effectively level-shift A1's output downward by 2 diodes, allowing the circuit output to swing to ground.

Amplifier A1 is used in a positive gain configuration. The feedback resistor R8 is 255Ω. The gain resistor is created from the parallel combination of R6 and R7, giving a Thevenin equivalent 63.5Ω connected to 3.75V. This gives an AC gain of +5 from the noninverting input of amplifier A1 to the cathode of D2. However, the video input is also attenuated before arriving at A1's positive

input. Assuming a 75Ω source impedance for the signal driving  $V_{IN}$ , the Thevenin equivalent signal arriving at A1's positive input is  $3V + 0.4V_{IN}$ , with a source impedance of 714Ω. The combination of these two inputs gives an output at the cathode of D2 of  $2 \cdot V_{IN}$  with no additional DC offset. The 75Ω back termination resistor R9 halves the signal again such that  $V_{OUT}$  equals a buffered version of  $V_{IN}$ .

It is important to note that the 4.7μF capacitor C1 has been added to provide enough current to maintain the voltage drop across diodes D1 and D2 when the circuit output drops low enough that the diodes might otherwise turn off. This means that this circuit works fine for continuous video input, but will require that C1 charge up after a period of inactivity at the input.
